ACB Sample Project Steps

Design an API X

Design an API

Define how the API will behave and how it communicates with other systems and APIs.

1  #%RAML 1.0
2  title: mss-generic-solutions-uapi
3
4  mediaType:
5    - application/json
6  version: v1
7  baseUri: http://{environment}/mss/gsol/{version}
8  baseUriParameters:
9    environment:
10      description: DEV, UAT, QA, PROD
11      enum: [DEV, UAT, QA, PROD]
12
13  /employees:
14    get:
15      queryParameters:
16        offset:
17          example: 1
18          type: number
19          format: int
20        limit:
21          example: 20
22          type: number
23          format: int
24      responses:
25        "200":
26          body:
27            type: object
28            properties:
29              nextoffset: integer
30              morepages: boolean
31              results:
```

```
31      results:
32        type: array
33        items:
34          properties:
35            employeeId: number
36            lastName: string
37            firstName: string
38            address: string
39            city: string
40      example:
41        {
42          "nextoffset": 10,
43          "morepages": true,
44          "results":
45            [
46              {
47                "employeeId": 1,
48                "lastName": "Wright",
49                "firstName": "Olivia",
50                "address": "909 Oak St",
51                "city": "Sacramento"
52              },
```

```

2      "nextoffset": 10,
3      "morepages": true,
4      "results":
5          [
6              {
7                  "employeeId": 1,
8                  "lastName": "Wright",
9                  "firstName": "Olivia",
10                 "address": "909 Oak St",
11                 "city": "Sacramento"
12             },
13             {
14                 "employeeId": 2,
15                 "lastName": "Nguyen",
16                 "firstName": "Daniel",
17                 "address": "111 Maple St",
18                 "city": "Kansas City"
19             }
20         ]
21     }
22 }

```

The screenshot shows an IDE window with a file named `mss-generic-solutions-uapi.raml`. The editor displays the following RAML content:

```

1  #%RAML 1.0
2  title: mss-generic-solutions-uapi
3
4  mediaType:
5  - application/json
6  version: v1
7  baseUri: http://{environment}/mss/gsol/{version}
8  baseUriParameters:
9      environment:
10         description: DEV, UAT, QA, PROD
11         enum: [DEV, UAT, QA, PROD]
12
13 /employees:
14     get:
15         queryParameters:
16             offset:
17                 example: 1
18                 type: number
19                 format: int
20             limit:
21                 example: 20
22                 type: number
23                 format: int
24         responses:
25             "200":

```

On the right side of the IDE, there is an **API Console** tab. It shows a visual representation of the API structure, including the `/employees` endpoint and its associated query parameters and responses.
